beauty booking platform

FEATURES & REQUIREMENTS

Admin Panel

Next.js 14 App Router — Web (Teddy platform operators)

The Teddy Admin Panel is the internal operations tool for Teddy platform operators. It provides full oversight and governance over vendors, users, content, finances, and platform configuration — giving operators the control needed to ensure quality, trust, and compliance.

Functional Features

Authentication

Admin login	Email and password login restricted to accounts with the admin role; all other roles rejected.
Session security	Short-lived JWT access tokens (15 min) with secure refresh; admin sessions logged server-side.

Vendor Management

View pending applications	Paginated list of all vendor applications awaiting review with submitted business details.

Approve vendor	Transition vendor status to APPROVED; vendor receives email notification and dashboard access is granted.
Reject vendor	Transition to REJECTED with a required reason; applicant notified by email with the rejection reason.
Suspend vendor	Immediately suspend an active vendor; all their live services are hidden from client search.
Reinstate vendor	Lift a suspension and restore the vendor to APPROVED status.
View all vendors	Full vendor list filterable by status (pending, approved, rejected, suspended) with search.
Vendor detail view	Inspect full vendor profile, services, booking history, payout record, and any flagged content.

User Management

View all users	Paginated user list with search by name or email; filter by role (client, vendor, staff, admin).
View user profile	Full user record including account details, booking history, loyalty tier, and point balance.
Ban user	Immediately disable a user account; all active sessions invalidated; account hidden from platform.

Unban user	Restore a banned user's account access.
View user bookings	Inspect complete booking history for any user for support or compliance purposes.

Dispute Resolution

View all disputes	List of open and resolved disputes raised by clients or vendors with submitted evidence.
Dispute detail	View full dispute timeline: parties involved, booking reference, evidence, and correspondence.
Resolve dispute	Record resolution outcome (refund approved, partial refund, no action) with an admin note.
Dispute history	Complete audit trail of all resolved disputes with resolution details and timestamps.

Payout Management

View all payouts	Full payout ledger filterable by vendor, status (pending, released, flagged), and date range.
Flag payout	Place a hold on a specific payout pending investigation; vendor notified automatically.

Release payout	Manually trigger a held payout; Stripe transfer initiated (mocked in dev, real in production).
Payout audit trail	Every flag and release action logged with admin identifier and timestamp.

Content Moderation

View flagged reviews	List of reviews flagged by vendors as inappropriate, with flag reason and flagging timestamp.
Hide review	Remove a review from public display while preserving it in the database for audit purposes.
Show review	Restore a hidden review to public visibility if the flag is deemed invalid.
Review audit log	All moderation actions on reviews logged with admin identity and rationale.

Platform Analytics

GMV dashboard	Gross Merchandise Value — total payment volume processed through the platform over any period.
Booking funnel	Conversion rates at each booking stage: search !’ profile view !’ booking created !’ confirmed !’ completed.

Revenue by category	Platform commission revenue broken down by service category.
Vendor performance	Ranked vendor leaderboard by revenue, booking count, and average rating.
User growth	New user registrations over time by role (client, vendor, staff).
Cancellation & no-show rates	Platform-wide and per-vendor cancellation and no-show rate trends.

Platform Settings

Commission rate	Adjust PLATFORM_COMMISSION_RATE; stored server-side and applied to all new transactions.
Points per dollar	Set POINTS_PER_DOLLAR loyalty earn rate for the rewards programme.
Payout delay	Configure PAYOUT_DELAY_DAYS — the number of business days after completion before payout release.
Feature flags	Enable or disable platform features (e.g. waitlist, OTP login) without redeployment.

Non-Functional Requirements

Security	Admin role enforced at both Next.js middleware and API route level — dual validation prevents privilege escalation. All admin API endpoints rate-limited independently. Admin actions require re-authentication after 30 minutes of inactivity.
Auditability	Every administrative action (approve, ban, resolve, flag, release) creates an immutable log entry with actor ID, timestamp, target entity, and action taken. Logs retained for 24 months minimum.
Access Control	RBAC middleware blocks any non-admin JWT from accessing /v1/admin/* routes. Admin tokens issued with a dedicated claim; vendor/staff tokens explicitly rejected.
Performance	Analytics queries pre-aggregated and cached in Redis (TTL 10 min) to avoid full table scans on large datasets. Paginated lists never load more than 50 records per request.
Reliability	Admin mutations (approve, ban, resolve) are wrapped in database transactions — partial failures roll back atomically. Duplicate action prevention via idempotency checks on payout release.
Usability	Designed for desktop browsers (1280 px+). shadcn/ui data tables with sortable columns. Inline confirmation dialogs for irreversible actions (ban, hide review). Clear status badge system across all entity lists.

Compliance	PII access in the admin panel is restricted to authenticated admin sessions only. No PII is ever exported to client-side state management — all sensitive queries remain server-side rendered.
