beauty booking platform

FEATURES & REQUIREMENTS

Staff Portal (Employer)

Next.js 14 App Router — Web (stylists, technicians & staff)

The Teddy Staff Portal (internally labelled "Employer") is the individual-contributor dashboard for stylists, nail technicians, and other beauty professionals employed by a vendor. Staff members receive a dedicated view of their own schedule, clients, earnings, and performance — separate from the vendor owner's dashboard.

Functional Features

Onboarding & Authentication

Accept invite	Staff receive a tokenised invitation link from their vendor; clicking it prompts account creation.
Set password	Staff create their own login credentials during the invite-acceptance flow.
Login	Email and password login scoped to the vendor_staff role; access limited to own data only.
Invite expiry handling	Invitation links expire after 7 days; vendor must re-send if not accepted in time.

Schedule Management

View weekly schedule	Calendar view of all assigned bookings for the current and upcoming weeks.
View daily agenda	Day-detail view listing each appointment in chronological order with client and service details.
Set availability	Define recurring weekly availability windows that the vendor uses for booking assignment.
View blocked slots	See any time blocks applied by the vendor (holidays, training) that exclude bookings.
Real-time updates	New bookings assigned to the staff member pushed instantly via Socket.IO.

Booking Management

View assigned bookings	Full list of bookings assigned to the logged-in staff member, filterable by status and date.
Booking detail	View client name, service, time, special notes, and payment status for each booking.
Start booking	Mark a booking as IN_PROGRESS when the client arrives.

Complete booking	Mark a booking COMPLETED; triggers loyalty point award and payout queue on the vendor account.
View booking history	Complete historical record of all past bookings handled by the staff member.

Client Management

View client list	All clients who have been served by the staff member, with visit count and last visit date.
Client booking history	View the history of bookings a specific client has had with the staff member.
Client notes	Read any vendor-supplied notes on a client's preferences or requirements.
Chat with clients	Participate in chat threads initiated by the vendor for client communication.

Earnings

Earnings dashboard	Overview of gross earnings, platform commission deducted, and net payable amount.
Earnings by period	Filter earnings by day, week, or month with transaction-level breakdown.
Per-booking earnings	See the exact amount attributable to each completed booking.

Payout history	Record of all payouts received, including dates and amounts.

Performance Metrics

Completion rate	Percentage of assigned bookings marked completed vs. cancelled or no-show.
Client rating	Average star rating received across all reviewed bookings.
Revenue generated	Total revenue attributed to the staff member's completed bookings over a period.
Booking volume trend	Month-over-month booking count chart showing workload trend.
Top services	Which services the staff member performs most frequently and generates most revenue from.

Profile & Settings

Edit profile	Update display name, bio, and profile photo (shown to clients when selecting a stylist).
Notification preferences	Toggle push notifications for new booking assignments, client messages, and schedule changes.
Change password	Self-service password change with current password verification.

Non-Functional Requirements

Security	vendor_staff JWT claim restricts API access to data scoped exclusively to the authenticated staff member. Cross-staff data access is blocked at service layer — a staff member cannot query another's bookings or earnings. Invite tokens are single-use and expire after 7 days.
Privacy	Staff can only view client PII (name, phone) for bookings assigned to them. Client contact details are never exportable or accessible in bulk.
Performance	Schedule and earnings pages use TanStack Query with stale-while-revalidate strategy — data loads instantly from cache while background refresh runs. Socket.IO delivers new booking assignments in under 200 ms.
Reliability	Offline-tolerant reads: last-fetched schedule cached in browser for reference during connectivity loss. Booking status transitions retry automatically on network failure with user-facing feedback.
Usability	Designed for both desktop (1280 px+) and tablet (768 px+) — staff commonly use iPads between appointments. Clear visual differentiation between upcoming, in-progress, and completed bookings via status colour coding.
Scalability	Staff portal is stateless — no server-side sessions. All data fetched per-request from the API with the JWT as the only identity source. Supports unlimited staff per vendor without configuration changes.

Maintainability	Staff portal shares the same shadcn/ui component library and TanStack Query setup as the Vendor and Admin apps, minimising duplication. TypeScript strict mode enforced throughout.
