beauty booking platform

FEATURES & REQUIREMENTS

Vendor Dashboard

Next.js 14 App Router — Web (salon owners & managers)

The Teddy Vendor Dashboard is a full business management platform for salon owners. It covers the entire operational lifecycle — from onboarding and service setup to real-time booking management, staff coordination, financial payouts, and growth analytics.

Functional Features

Onboarding & Authentication

Vendor application	Submit business details, service categories, and supporting documents for admin review.
Application status tracking	View current application status (Pending, Approved, Rejected, Suspended) on login.
Login with email & password	JWT-based session; vendor_owner role required to access dashboard.
Password reset	Email-based password reset flow with tokenised link.

Business Profile

Edit business profile	Update business name, description, address, phone, website, and operating hours.
Upload portfolio photos	Add gallery images to showcase the salon environment and work quality.
Service categories	Tag the business with relevant service categories visible in client search.

Service Management

Create service	Define service name, description, category, duration (minutes), and price.
Edit service	Modify any service attribute; changes reflected immediately in client search results.
Delete service	Soft-delete removes the service from discovery while preserving booking history.
View all services	Paginated service list with quick edit and status toggles.

Booking Management

View all bookings	Paginated booking list filterable by status, date range, staff, and service.
Today's bookings	Dashboard widget showing all appointments for the current day in chronological order.

Weekly calendar view	Week-at-a-glance grid displaying all bookings by day and time slot.
Confirm booking	Manually confirm a PENDING booking; client notified via push and email.
Start booking	Mark booking as IN_PROGRESS when the client arrives; triggers no-show detection job.
Complete booking	Mark booking COMPLETED; awards client loyalty points and queues payout release job.
Cancel booking	Cancel on behalf of the vendor; full refund automatically initiated for the client.
Mark no-show	Record a client no-show; booking transitions to NO_SHOW status for record-keeping.
Real-time updates	New bookings and status changes pushed instantly via Socket.IO /booking namespace.

Staff Management

Invite staff member	Send email invitation with a tokenised link; staff accept and create their own portal account.
View staff list	See all staff members with their role, current bookings, and earnings summary.

Set staff availability	Define recurring weekly availability templates per staff member (days and time windows).
Block time slots	Add one-off blocked slots (holidays, training) to prevent bookings during those periods.
Assign bookings to staff	Link each booking to a specific staff member at the time of booking creation.
View staff performance	Per-staff breakdown of completed bookings, revenue generated, and client ratings.

Analytics

Revenue analytics	Daily, weekly, and monthly revenue charts with period-over-period comparison.
Booking volume	Count of bookings by status (confirmed, completed, cancelled, no-show) over time.
Occupancy rate	Percentage of available slots filled; highlights peak days and underutilised windows.
Top services	Ranked list of best-performing services by revenue and booking count.
Client retention	New vs. returning client ratio and repeat-booking frequency metrics.

Top clients	Ranked list of highest-value clients by total spend.

Payouts

View payout history	List of all payouts with gross amount, platform commission (15%), net amount, and status.
Payout schedule	Payouts released automatically T+2 business days after each booking completion.
Pending payout balance	Dashboard widget showing total funds currently queued for release.
Payout flagging	Admin can flag a payout for review; vendor notified and payout held until resolved.

Client Management

Client list	All unique clients with total visit count, total spend, and last visit date.
Client profile	View individual client booking history, notes, and loyalty tier.
Initiate chat	Start a chat thread with a client (only vendors can initiate per platform rules).
Before & after upload	Upload before-and-after photo pairs linked to a specific completed booking.

Non-Functional Requirements

Performance	Next.js App Router with React Server Components for fast initial page loads. TanStack Query (React Query) manages client-side data fetching with background revalidation. Dashboard analytics cached in Redis for 10 minutes.
Security	Role-based access control: vendor_owner and vendor_staff roles enforced at middleware level. API routes validate vendor ownership on all data mutations. Session tokens stored in httpOnly cookies; CSRF protection enabled.
Reliability	Optimistic UI updates via TanStack Query for booking state changes. Graceful error boundaries on every dashboard page. Socket.IO reconnects automatically on network interruption.
Scalability	Stateless Next.js deployment; horizontal scaling via Firebase Hosting CDN for static assets. Redis adapter ensures Socket.IO real-time events propagate across all API instances.
Usability	Responsive design works on 1280 px desktop down to 768 px tablet. shadcn/ui component library ensures WCAG 2.1 AA accessibility compliance. Inline form validation with Zod schema messages.
Data Integrity	All booking state transitions validated server-side against the state machine. Slot locks in Redis prevent concurrent double-booking. Payout amounts calculated from Prisma aggregates, never from client input.

Auditability	All booking status changes, payout events, and admin overrides written to structured Winston logs. Timestamps stored in UTC; displayed in vendor's local timezone.
